

Slideshows NEED WORK!

ok, I like concept of the program. As a programmer, this program has a lot to be desired. Especially all of the code that is generated, damn! However, there are a few things that really need to be put into the slideshows.

#1, as a photographer who is loading 100 - 200 images in a slideshow, there needs to be a button in the options to clear out the images in that slideshow without having to pull up the thumbnails and have to go through and click on every one of them that I want to delete, especially when I don't want the thumbnails on my presentation, man, this is BS and very tedious. If you accidentally click off of a thumbnail, all of the thumbnails selected become deselected so you have to start all over again.

#2, I have noticed that as a slideshow is playing, everything works fine, however, once you click the next, previous, first, last buttons, you have to reload the page to get the slideshow to continue. There needs to be a "resume" button or a "stop" / "play" option. This even happens on phone and tablet, if you touch the image, the slideshow stops until you go and reload the page. I would think that a timeout period to resume the slideshow on the phone and tablet that would begin the slideshow automatically.

#3. Once I upload the images into a slideshow, I have no logical way to list the files that are in that slideshow, so, if I go back and have to re-upload an image, instead of letting me know that an image with that name already exists, it simply adds it image to what is already there. The other day I uploaded a jpeg but it only uploaded half of the file, I decided to re-upload the file which should have overwritten the original, but of course, instead, it added the new file. There should have been a warning or something that the file exists, do you want to overwrite, create new or cancel. This is really not a problem with small slideshows, but I am a professional photographer who needs to post 300-2000 images daily. Muse, is not yet a viable option for photographers or businesses with numerous images that must be available to the user(s). Also, as in another of my posts, there seriously needs to be a way to incorporate dynamic xml documents and or coldfusion template generation abilities and or a Muse plugin option for Dreamwweaver for Coldfusion developers at the very least so that the content can be pulled and from a database or xml document(s).
