

Idea: New editor - improve image controls

- In the old editor you could add an image and then float it left/right, add margin etc. Of course in the old editor this meant it inserted inline styles, which wasn't ideal. If the CSS styles function was working, we could define a class in that list like ".img-left", thus avoiding the inline styles problem, but allowing clients the flexibility they need when inserting images. If there's another solution that's better someone chime in on this.
- It would also be helpful for On Page SEO if we could define image alt tags via the insert method.
